ZAK MCP Gateway v0.4.1

11 Nov 2026 · Published on npm

The gateway becomes an npm package any project can install. No change to how it saves tokens: same meta-tools, same defaults, same results as v0.4.

> **In one picture:** The concierge desk is now sold as a kit: every building installs its own with one command instead of copying the original.

What's new

Feature	What it does (simply)	Where to switch it
npm package	npm install --save-dev zak-mcp-gateway; npx zak-mcp-gateway runs it. Ships only the compiled gateway, the example config, README and LICENSE.	files list in `package.json`
init command	Writes a small working config (one GitHub server, secrets as references) and prints the agent entry with real paths; cmd /c form on Windows; never overwrites without --force.	zak-mcp-gateway init
--version	Prints the installed version.	zak-mcp-gateway --version
Library entry	import or require the gateway and its parts, with TypeScript types.	exports in `package.json`
Safer installs	Minimum dependency versions raised to the tested ones (MCP SDK 1.32, MiniSearch 7.2, zod 3.25), so a project cannot pull in an older SDK without elicitation support.	dependencies
Release checks	npm publish runs the full test suite, then a clean build (no stale files, no source maps).	prepublishOnly, prepack

Measured

What	Result
Package	86.2 kB packed, 425.6 kB unpacked, 74 files
Tests	67 of 67 pass (2 new: init and --version)
Installed into an empty project	init, --version, import and require, and a full MCP session over stdio through npx (search, call, sandboxed code mode, report) all work

Notes

- Known: npm audit reports zod below 4.6.6 (memory use on oversized collections). zod only checks the local config file here and messages inside the MCP SDK; the fix needs zod 4, whose default handling changes the config schema, so it is planned as its own change.
- Register only the gateway with an agent, with an absolute --config path.
